

**Restoration Plan for the Northwest Fork of the Loxahatchee River.** BSS provided technical editing support to the District's Watershed Management Department throughout the production of this report. The Loxahatchee River report represented a significant interagency effort among state and local agencies. In addition to freshwater, terrestrial, and estuarine ecosystem data, this report integrated results from hydrologic, freshwater flow, and salinity models in formulating the preferred restoration flow scenario. Working closely with the District's co-project managers, BSS collected, compiled, reviewed, and edited the information for each chapter. BSS also assembled the completed chapters and appendices into the Final Draft.
